

Indian Stock Market

Power BI Analytics Dashboard

A Business Intelligence Report on Company Fundamentals, Valuation & Quality Analysis of Listed Indian Equities

Tool	Scope	Report Date
Microsoft Power BI Desktop (.pbix)	Indian Listed Equities — Fundamentals & Valuation	August 2026

1. Project Overview

What This Dashboard Does

The "Indian Stock Market" Power BI dashboard is a single-page interactive report that evaluates a universe of Indian listed companies across **four fundamental dimensions**:

- Valuation — PE Ratio
- Capital Efficiency — ROCE
- Scale — Market Capitalisation
- Growth Momentum — Profit & Sales Growth

Classification & Screening

Each company is classified into intuitive **quality / value / valuation buckets** that support quick investment screening — removing the need for manual analysis.

Technical Architecture

The report is built entirely with **native Power BI visuals** — cards, bar charts, donut charts, clustered column charts, a gauge, and slicers — driven by a dedicated **DAX measures table**, making it easy to filter, drill down, and refresh as new market data becomes available.

2. Objectives

The dashboard was designed to fulfil six distinct analytical objectives, spanning data consolidation, automated classification, and interactive exploration:

1

Consolidate Fundamentals

Bring key metrics — Market Cap, ROCE, PE Ratio, Profit Growth, Sales Growth — into a single unified view for Indian listed companies.

2

Automate Classification

Classify companies as **Quality, Value, or Overvalued** using rule-based DAX logic, eliminating manual screening effort.

3

ROCE Segmentation

Highlight capital-efficiency leaders and laggards through ROCE-based segmentation of the covered universe.

4

Valuation Stance

Assess market-wide valuation (cheap vs. fair vs. expensive) via PE ratio distribution across all companies.

5

Growth Health Check

Provide an at-a-glance pulse on how many companies are growing profits/sales vs. declining.

6

Interactive Exploration

Enable filtering by company and by market-cap category through dropdown slicers driving cross-filtering across all visuals.

3. Tools & Data Model

The dashboard is built on a lean, single-table data model with a dedicated measures layer — ensuring clean separation between raw data and analytical logic.

Component	Details
BI Tool	Microsoft Power BI Desktop (.pbix)
Data Table	"Indian Stock Market" — one row per company, with columns: Company, Market Cap Crore, ROCE Percent, PE Ratio, Current Price INR, Quarterly Profit/Sales Growth Percent, Market Cap Category, Highest ROCE Value, and Largest Market Cap Company.
Measures Table	"Indian Stock Market Measures" — a dedicated table of 25+ DAX measures covering totals, averages, min/max, and rule-based company counts.
Report Canvas	1 page (1366 × 768), 29 visual objects : 5 KPI cards, 2 bar charts, 2 donut charts, 2 clustered column charts, 1 gauge, 2 slicers, plus titles/shapes.
Interactivity	Dropdown slicers for Company and Market Cap Category drive cross-filtering across all visuals.

4. Dashboard Layout

The single canvas is organised into **three functional zones**, each serving a distinct analytical purpose:

KPI Strip — Top

Five summary cards: **Total Market Cap**, **Quality Companies**, **Average ROCE %**, **Average PE Ratio**, and **Total Companies** — giving an instant market snapshot.

Comparative Charts — Middle

Bar charts ranking **Top 5 by Market Cap** and **Top 5 by ROCE %**, alongside donut charts showing the **Quality/Value/Overvalued split** and the **Valuation (PE) distribution**.

Diagnostics — Bottom

A **Growth Health Check** column chart, a **ROCE Quality Split** chart, an **Average ROCE gauge**, and spotlight cards for Highest ROCE and Largest Market Cap Company, supported by slicers.

#	Visual	Type	Fields / Measures Used
1	Total Market Cap	KPI Card	Total Market Cap
2	Quality Companies	KPI Card	Quality Companies
3	Average ROCE %	KPI Card	Average ROCE %
4	Average PE Ratio	KPI Card	Average PE Ratio
5	Total Companies	KPI Card	Total Companies
6	Top 5 by Market Capitalisation	Bar Chart	Company × Sum(Market Cap Crore)
7	Top 5 by ROCE %	Bar Chart	Company × Sum(ROCE Percent)
8	Quality vs Value vs Overvalued	Donut Chart	Quality / Value / Overvalued Companies
9	Valuation Distribution	Donut Chart	High / Fair / Low PE Stocks
10	ROCE Quality Split	Clustered Column	Companies with ROCE <10% / >20%
11	Growth Health Check	Clustered Column	Positive/Negative Profit & Sales Growth Companies
12	Average ROCE Gauge	Gauge	Average ROCE %
13	Highest ROCE Value	KPI Card	Highest ROCE Value (column)
14	Largest Market Cap Company	KPI Card	Largest Market Cap Company (column)
15	Company Filter	Slicer (dropdown)	Company
16	Market Cap Category Filter	Slicer (dropdown)	Market Cap Category

5. KPI & Measure Definitions

All classification logic is **rule-based and defined centrally** in the DAX measures table, ensuring consistent, auditable screening criteria across every visual. The table below documents each measure and its precise DAX threshold logic:

Measure / Segment	Definition (DAX Logic)
Quality Companies	ROCE % ≥ 20 AND Quarterly Profit Growth % > 0 AND Quarterly Sales Growth % > 0
Value Companies	PE Ratio < 20 AND ROCE % > 20
Overvalued Companies	PE Ratio > 50
Low PE Stocks	PE Ratio < 15
Fair PE Stocks	$15 \leq \text{PE Ratio} \leq 30$
High PE Stocks	PE Ratio > 30
Companies with ROCE $> 20\%$	ROCE % > 20 — capital-efficiency leaders
Companies with ROCE $< 10\%$	ROCE % < 10 — capital-efficiency laggards
Positive Profit Growth Companies	Quarterly Profit Growth % > 0
Negative Profit Growth Companies	Quarterly Profit Growth % < 0
Positive Sales Growth Companies	Quarterly Sales Growth % > 0
Negative Sales Growth Companies	Quarterly Sales Growth % < 0
Average Profit Margin Indicator	AVERAGE(Profit Growth %) + AVERAGE(Sales Growth %)
Average ROCE-to-PE Ratio	AVERAGE(ROCE %) $\div$ AVERAGE(PE Ratio) — a blended efficiency-per-valuation-unit score
Average Market Cap per Company	Total Market Cap $\div$ Total Companies

📌 All thresholds are encoded once in the DAX measures table and propagate automatically to every visual — ensuring no inconsistency between charts.

6. Analytical Insight Framework

The dashboard's six analytical subsections each address a distinct investment question, together forming a complete fundamental screening workflow:

6.1 Market Composition & Scale

Total Market Cap and **Average Market Cap per Company** KPI cards reveal the overall size of the covered universe and how concentrated it is. The **Top 5 Companies by Market Capitalisation** bar chart identifies the mega-cap names that dominate index weight and typically drive overall market sentiment.

6.2 Capital Efficiency (ROCE)

The **Average ROCE % KPI and gauge** give a single benchmark figure for how efficiently the covered companies deploy capital. The **ROCE Quality Split** chart contrasts companies with ROCE below 10% (potential red flags) against those above 20% (strong, efficient operators). **Top 5 by ROCE %** spotlights the most capital-efficient businesses — often useful as a quality-investing shortlist.

6.3 Valuation

The **Valuation Distribution donut** (Low PE <15 / Fair PE 15–30 / High PE >30) shows whether the market is cheaply valued, fairly priced, or running hot — useful for gauging overall market sentiment and risk. **Average / Max / Min PE Ratio** measures let a user judge how wide the valuation spread is across the universe.

6.4 Quality vs. Value vs. Overvalued Screening

The **Quality vs Value vs Overvalued donut** is the dashboard's core screening output: it segments the universe into (a) Quality names with high ROCE and positive growth, (b) Value names with low PE but strong ROCE (cheap and efficient), and (c) Overvalued names trading above a PE of 50. A large Overvalued slice signals late-cycle/expensive conditions; a large Quality or Value slice signals attractive stock-picking opportunities.

6.5 Growth Momentum

The **Growth Health Check** chart compares how many companies are growing vs. shrinking on both the profit and sales lines — a quick pulse check on earnings momentum across the market. The **Average Profit Margin Indicator** (growth-based composite) flags whether growth is broadly positive or negative in aggregate.

6.6 Spotlight Companies

Highest ROCE Value and **Largest Market Cap Company** cards call out the single best-in-class performer on each dimension for quick reference — providing an immediate anchor for further investigation.

7. How to Read the Live Numbers

The .pbix file stores its data in Power BI's compressed **VertiPaq data-model format**, which is only queryable from within Power BI Desktop / Analysis Services — it cannot be read from the file on disk without opening the report. Because of this, the specific figures (e.g., the exact Average ROCE %, the actual Top-5 company names, or the Quality/Value/Overvalued split percentages) **could not be extracted for this report**.

⚠ Live dashboard figures, company names, percentage splits, and other underlying values are not available in this document. The framework and methodology are fully documented; the numbers must be read directly from the open .pbix file.

To turn this framework into a numbers-filled executive summary, either of the following approaches works:

1 Read Directly from Power BI Desktop

Open the .pbix in Power BI Desktop and read the KPI cards and chart labels directly, or use **"Copy visual as image/data"** on each visual to extract the displayed figures.

2 Export the Underlying Data Table

Export the "Indian Stock Market" table via **Power BI → right-click table → "Copy Table"**, or **File → Export Data** on a table visual, to CSV/Excel. The exact figures, top companies, and percentage splits can then be computed and inserted into Section 6 directly.

8. Conclusion

The "Indian Stock Market" dashboard provides a compact, rule-driven framework for screening Indian listed companies on quality, value, and valuation risk.

Core Strength

The dashboard's strength lies in **centralising screening logic** — ROCE, PE, and growth thresholds — into reusable DAX measures, so the same criteria apply consistently across every chart and can be refreshed as new quarterly data arrives.

25+ DAX Measures

Centralised, auditable classification logic covering totals, averages, and rule-based counts.

29 Visual Objects

A single 1366×768 canvas delivering a complete fundamental screening workflow in one view.

Practical Applications

With the underlying dataset in hand, this dashboard can support:

- **Quick fundamental screening** across the Indian listed universe
- **Watch-list generation** based on Quality, Value, or ROCE criteria
- **Market-health monitoring** for an Indian equities portfolio
- **Quarterly refresh** as new profit and sales growth data becomes available

3 Screening Buckets

Quality, Value, and Overvalued — each defined by precise, consistent ROCE and PE thresholds.

Fully Refreshable

Replace the source data and all measures, charts, and classifications update automatically.
